Abstract
The species of Artocarpus (Family Moraceae) often was known as the fruit like the jackfruit (Artocarpus heterophyllus) and cempedak (A. integer) but also that was potential as the foodstuff like breadfruit (A. Altilis) and the other species. However the diversity of the species in the Artocarpus often was not yet known so also concerning his cultivated technique. The Bogor botanic garden as the conservation agency played a role in socialising these plants kinds but also developed him in Seedling Cultivation of Bogor botanic garden. The description of morphology and the habitat and his spreading as well as his developing were explained in detail to this paper.
